Launchpad

What is Launchpad?

"A code hosting and collaboration platform"

"The platform for Ubuntu development"

"PPA hosting platform"

"A bug tracker"

"Hosts projects with mailing lists"

"Allows you to translate your open source projects"

Launchpad is these and much more!

Malone is a Web-based global bug tracker. It is designed to track bugs across the whole open source process: it understands that the same code is re-used upstream and in different distributions, and allows us to have a single bug number for any bug, and track where it has been fixed and where it is still a problem.

Listed bounties:

Tracking bugs:

You can register your bounties in the Launchpad so people can find them more easily.

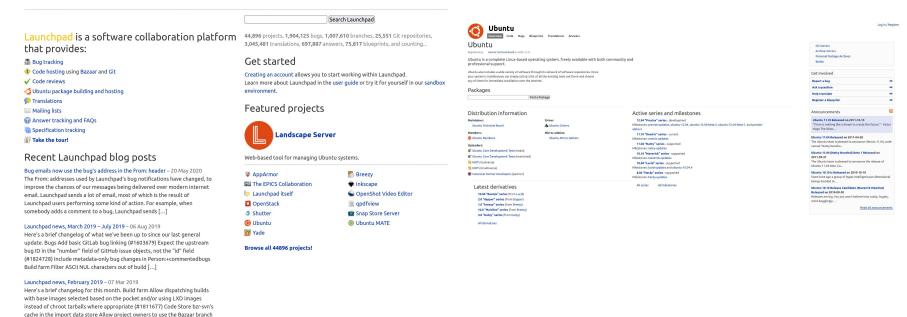

Top bounties:

USD 300.0: Relationships Overview for Glom

New code review UI

https://edge.launchpad.net/~cjwatson/launchpad/+git/launchpad/+merge/437038

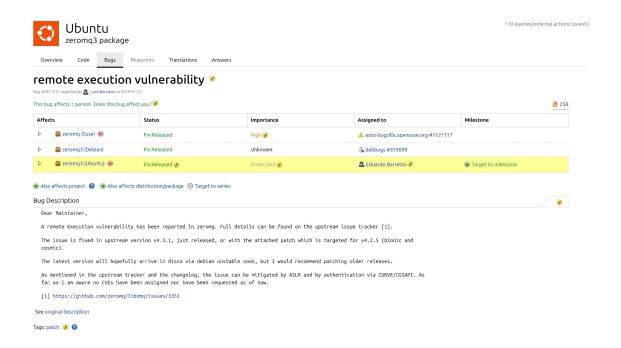

Handling aggregate distributions of software.

Tracking & federating information with other places where similar software is maintained.

This LP bug tracks a vulnerability in Ubuntu, Debian, & Suse

It also tracks comments from the remote Suse bug tracker

Bug watches

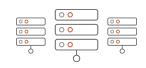

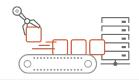

#2 Launchpad build farm

Launchpad build farm

750+

9*

1000s

Builders

Architectures

Daily builds

https://launchpad.net/builders

Launchpad build farm

Available to Launchpad users, Ubuntu, and open source communities free of cost.

Build deb packages (Ubuntu/PPAs), snaps, charms, livefs, OCI images, rocks, and many more to come.

Support for more architectures in the works. amd64v3 since 25.10. riscv64 builds became self-service at the end of 2023.

Works great with source code hosted on Launchpad but also works with source hosted externally in many cases.

Launchpad build farm

Do you want to build a snap on architectures that you don't have access to?

With the snapcraft remote-build command, you can build it on the Launchpad build farm and the built snap locally.

There is a similar charmcraft remote-build command that does the same for charms.

#3 Recipes

"I want to automatically build and upload/publish artifacts when the underlying source code changes"

- Source package recipes
- Snap recipes
- Charm recipes
- Rock recipes
- (more to come)

lpci Snap packages » lpci Created by Colin Watson on 2021-12-09 and last modified on 2024-05-02 Snap package information Owner: Source: 🔣 Canonical Launchpad Engineering 🕜 lpci:main 🕖 Build schedule: 🔞 **Build source tarball:** No 🕐 Built automatically 🕖 Source archive for automatic builds: Pocket for automatic builds: n Primary Archive for Ubuntu Updates 🕜 Source snap channels for automatic builds: 🕖 7.x/stable snapcraft Store series: Registered store package name: Ubuntu Core 16 📝 lpci 🏈 Store channels: edge 📝

Create a new snap package

Snaps are Linux app packages for desktop, cloud and IoT that are simple to install, secure, cross-platform, and dependency-free. Launchpad can build snap packages using snapcraft, from any Git or Bazaar branch on Launchpad that has a snap/snapcraft.yaml, build-aux/snap/snapcraft.yaml, snapcraft.yaml, or .snapcraft.yaml file at its top level.

nap recipe name:		
The name of the snap build recipe.		
Owner:		
Guruprasad (lgp171188)		~
The owner of this snap package.		
nformation type:		
Public v		
The type of information contained in this Snap rec	ipe.	
ource:		
O Bazaar		
Bazaar branch:		
Q,		
A Bazaar branch containing a snap/snapcraft	yaml, build-aux/snap/snapcraft.yaml, sna	pcraft.yaml, or
.snapcraft.yaml recipe at the top level.		
Ogit		
Git branch:		
Repository:	Branch:	Q
The Git branch containing a snap/snapcraft.y	aml build-aux/snan/snancraft vaml snan	craft vaml or
.snapcraft.yaml recipe at the top level.	arm, band day shap; shaperare. yarm, shap	crarc.yarm, or
.snaperare.yami recipe actine cop tevet		
eries:		
o Infer from snapcraft.yaml (recommended)		
O Ubuntu Bionic		
O Ubuntu Artful		
O Ubuntu Zesty		
O Ubuntu Yakkety		
O Ubuntu Xenial		

Processors: (Optional)
✓ AMD x86-64 (amd64)
ARM ARMv8 (arm64)
ARM ARMv7 Soft Float (armel)
ARM ARMv7 Hard Float (armhf)
☐ HP PA-RISC (hppa)
✓ Intel x86 (i386)
☐ Intel IA64 (ia64)
☐ Intel x86 Low Power (lpia)
PowerPC (powerpc)
☐ PowerPC64 Little-Endian (ppc64el
RISC-V 64-bit (riscv64)
☐ IBM System z (s390x)
☐ Sun SPARC (sparc)

The architectures that this snap package builds for. Some architectures are restricted and may only be enabled or disabled by administrators.

☐ Build source tarball

Whether builds of this snap package should also build a tarball containing all source code, including external dependencies.

п	Automaticall	v build	when	hranch	changes

Whether this snap package is built automatically when the branch containing its snap/ snapcraft.yaml, build-aux/snap/snapcraft.yaml, snapcraft.yaml, or .snapcraft.yaml recipe changes.

Source archive for automatic builds:

Primary Archive for Ubur	itu
O PPA	Q

The archive from which automatic builds of this snap package should be built.

Pocket for automatic builds:

The package stream within the source archive and distribution series to use when building the snap package. If the source archive is a PPA, then the PPA's archive dependencies will be used to select the pocket in the distribution's primary archive.

Source snap channels for automatic builds:

core	
core18	
core20	
core22	
core24	
snapcraft	
snapd	

The channels to use for build tools when building the snap package. If unset, or if the channel for snapcraft is set to "apt", the default is to install snapcraft from the source archive using apt.

☐ Automatically upload to store

Whether builds of this snap package are automatically uploaded to the store.

Registered store package name:

The registered name of this snap package in the store.

Store channels:

Channels to release this snap package to after uploading it to the store. A channel is defined by a combination of an optional track, a risk, and an optional branch, e.g. '2.1/stable/fix-123', '2.1/stable,' istable/fix-123', or 'stable'.

Track	Risk	Branch	Delete?
T	(nothing selected) 🗸		

Automatic recipe builds when the associated code repository (even outside of Launchpad) changes
Automatic upload/publishing of the artifacts built
Can also trigger builds manually

Creating recipes

- Snap recipe
 https://launchpad.net/project/+new-snap
- Charm recipe
 https://launchpad.net/project/+new-charm-recipe
- deb package recipe
 https://code.launchpad.net/path/to/branch Click on 'Create packaging recipe'

Provides a point-in-time snapshot of

- Ubuntu archive
- Launchpad PPAs (public and private)
- (more to come)

Powered by Launchpad, the platform and the engine behind Ubuntu development and publishing.

Launchpad maintains a history of every change to Ubuntu and that makes this possible.

lp-archive is a small web service that implements this on top of Launchpad.

Use cases

- Reproducible deployments
- Determining when a change happened
- Structured update workflow

How do I use this?

Ubuntu - https://snapshot.ubuntu.com

PPAs - https://snapshot.ppa.launchpadcontent.net

Automatic apt integration

To know more, watch this presentation from my former colleague Colin Watson at the Ubuntu Summit 2023

#5 Launchpad CI

Launchpad has built-in CI functionality that runs CI jobs on merge proposals

lpci, the runner tool, the makes this possible

Runs on Launchpad builders and locally. Needs a .launchpad.yaml configuration file

Generally available, but still in early stages of development

```
$ cat .launchpad.yaml
pipeline:
- test
jobs:
   test:
        series: focal
       architectures: amd64
        run: echo hello world >output
       output:
            paths: [output]
$ lpci run --output-directory out
Running the job
$ tree out # Find out the location of the output file
out
└─ test
          files
            └─ output
           properties
3 directories, 2 files
$ cat out/test/0/files/output
hello world
```

Unmerged commits

513b1bc... by a Colin Watson on 2023-11-26

charm: Only run push-backups on primary database units

We don't want to be pushing backups from more than one unit.

Extensible via plugins

Built-in plugins for conda-build, Miniconda, pyproject-build, tox, and golang.

Contributions welcome!

https://lpci.readthedocs.io

#6 Launchpad API

A web service API to interact with Launchpad

Documented at https://api.launchpad.net.

devel version is the currently maintained one.

Allows doing almost everything that can be done with the web application, sometimes even more.

launchpadlib

- The official Launchpad Python client library
- apt install python3-launchpadlib or pip install launchpadlib.
- lp-shell (i)python-based REPL environment playground

```
# lp-shell gives you the `lp` object that is an instance of the API client.
In [1]: person = lp.people["cjwatson"]
In [2]: person
Out[2]: <person at https://api.launchpad.net/devel/~cjwatson>
In [3]: person.display_name
Out[3]: 'Colin Watson'
```

Get the display name of a user

```
user = lp.load("~wgrant")

for question in user.searchQuestions(participation="Owner", sort="newest first")[:3]:
    print(question.title)

# 66189 Merge william-grant into wgrant
# 63675 Debian's series to remove 'Debian ' from the front
# 62675 Debian series need updating and data needs fixing
```

Get the most recent 3 questions posted by a user

```
git_repository = lp.git_repositories.new(name="launchpadlib-demo", owner=lp.me, target=lp.me)
print(git_repository.web_link)
# https://code.launchpad.net/~lgp171188/+git/launchpadlib-demo
git_repository.name = "lp-shell-demo"
git_repository.lp_save()
git_repository.lp_refresh()
print(git_repository.name)
# lp-shell-demo
git_repository.lp_delete()
```

Create a git repository, modify its name, and delete it

Launchpad API documentation

Examples

- Support for FIDO2 SSH keys
- Bazaar and mailing lists shutdown
- Bug templates
